

Use Timers and Cross-Browser Utility

Finish last week's lab (with the list and the mouse pointer event) and then extend it as follows:

1. Rewrite it to use `utilities.js`, the cross-browser utility library we looked at last week. It's in the `04_forms` example code.
2. Use a timer to delay how soon the tiny red box follows the mouse pointer.

As usual, please upload your solution to Moodle so I can potentially give you feedback.

When you're done, please work on your Project 1 Part 2.
